

Tailored Seed Treatments to meet your specific requirements

(continued from previous page)

Take Off PGA:

A Phosphite based plant stimulant with its unique Pyra-Glutamic Acid complex optimising plant establishment as well as root and shoot mass. Offering enhanced emergence, enhanced rooting, healthier more resilient crop all helping to optimise yields.

Untreated control

Take Off

Zax: (Zn)

Zinc is used in enzymes, amino acid and protein synthesis and is increasingly found to be deficient from tissue analysis. Zax provides an available form of Zinc from germination contributing to early plant development and structure, grain yield and quality.

Agnition: (Cu)

Copper is used in electron transfer in chloroplast (chlorophyll). Only very severe deficiencies will show as yellowing and spiralling of leaves, trapped ears and poor grain fill. Soil analysis should be carried out to determine Cu levels.

Signal:

A highly effective insecticide seed treatment for reduction of wheat bulb fly and wireworm damage to autumn/winter sown wheat and barley.

LAB Tests

Agrii offer discounted rates for all pathological and quality tests via its ministry approved seed labs or via NIAB. Take the easy route of pre-paid addressed sample bags and a tick box label for tests required. TGW's also carried out at point of processing.
