Hybrid Oilseed Rape – East & West

- ✦ A new RL hybrid with high gross output
- ✦ Excellent disease profile including the new RLMS stem canker genetics

- ✦ A leading RL hybrid that performed well in Agrii trials last year with high treated (108%) and very high untreated (103%) yields. It has a moderate autumn and spring growth habit, stiff canopy and outstanding disease resistance which makes it a suitable variety for earlier drilling. It has also performed consistently well in AHDB trials over the past three years.
- ✦ Suitable for all soils and the East and West region of the UK until further information is available. Suitable for drilling from early August right through to early September. Relatively tall (143 cm), good stem stiffness (8), lodging resistance (8) and medium maturity (5).
- ✦ Excellent disease profiles including the new RLMS genetics from LSPB. This provides more robust control of stem canker compared with any other varieties including RLM7 resistance isolates. It also has a robust light leaf spot rating (7) and the best tolerance of Verticillium wilt (8) of any variety tested by Agrii last year. It does not have the trait for pod shatter resistance or TuYV.
- ✦ BREEDER: LSPB UK
